

Apex™: Front-End Function, Back-end Braun

The versatile SaaS solution to clinical documentation

Health care. In few fields is IT more critical — or more challenging. Medical facilities require accurate, up-to-date records that are handled in strict compliance with HIPAA regulations. HIM has come a long way, but there is a predictable bottleneck: documentation.

Despite the introduction of documentation tools like templating, speech recognition and direct data entry, patient-data capture has continued to plague facilities because of inefficient workflow and poor integration. Where costs of EMR at large have gone down, the costs of clinical documentation at many facilities have been higher than ever, with no end in sight...until now.

Apex™ — Transolutions' clinical documentation platform — facilitates all areas of the data-capture process, including digital dictation, speech recognition, transcription, digital signing and document distribution. Software-as-a-Service, it is fully customizable and designed to integrate with your existing HIS/EMR.

On-demand, a-la-carte functionality makes Apex™ integration seamless, and a flexible interface allows users to tailor look and feel without compromising consistency at the organizational level.

Apex™ has been tested extensively with:

EMRs:

- Cerner
- Epic
- Siemens
- Meditech
- SoftMed
- Eclipsys
- McKesson

Voice Systems:

- DictaPhone
- Lanier
- Crescendo
- Dolby

Real problems, real solutions

In the high-performance, high-pressure healthcare environment, the last thing you need is more complexity. Our custom software packages pair Apex™ with proven technologies for a comprehensive solution to your documentation needs.

- **Apex™ Speech Recognition:** A highly configurable, service-oriented architecture (SOA) — together with Apex's thin client interface — increases the productivity of medical language specialists and clinicians, and lowers production costs.
- **Apex™ Wireless Handheld Solution:** Make real-time patient data, lab results, medications and transcription reports available to clinicians on any device with a web browser and a Wi-Fi connection. You can simplify your IT requirements and extend existing systems through a single, mobile platform that aggregates all the data caregivers need to do their job effectively.

Powerful Integration: Apex™ marries seamless interfacing technology with a host of productivity tools designed specifically for the medical transcription industry. Unlike standalone interface engines, Apex™ keeps everything needed for documentation all in one place, reducing hassle and boosting productivity for administrators, caregivers, and clerical staff alike.

IT professionals will appreciate that Apex™ delivers a powerful interface platform together with the medical documentation components their facilities need — a solution that eliminates the need for costly custom programming.

And transcription was never more streamlined. Apex™ audio trans-code routines allow users to collect and convert voice files from virtually any source and produce timely, accurate documents using automated tools — all within a single, web-accessible environment. Interface engines were simply not designed to do this.

Ultra-secure Tier-1 Data Center

Transolutions' Data Center protects your information in one of the country's premier fortified structures. This building keeps information securely in the United States, and is designed to protect your patient and administrative data from even the most catastrophic events. The Data Center is staffed with round-the-clock, on-site technical personnel who actively support our clients and the network that serves them.
